Where's Timmy?
He's trying to learn c++
after finishing his python course

OH GOD NO

C++ Tutorial

Outline

- My first *Hello world* in C++/Unix
  - GCC compiler flags
- Headers, libraries
  - Compilation chain
  - Namespaces
  - Other feature (macros)
- Arrays, vectors (stdc++), ..
  - Static vs. Dynamic memory
- AoB

My first *Hello world* in C++/Unix

Write your .cpp file, compile with GCC/G++

- `$ gcc 01-helloworld.cpp -o 01-helloworld`
- In Cygwin, produces `01-helloworld`**`.exe`**

GCC useful flags

- `-I <INCLUDE-FOLDER>` (capital 'i')
- `-l <LIBNAME>` ('l' di Livorno) : link specific library
  - `libstdc++.a` => `-l stdc++`
- `-o <EXEC-NAME>` [Default `a.out`]
- `-Wall` : enable all Warning messages

Headers, libraries

Include headers to let compiler find the symbols

- Es: We want to use `cout, endl`
- `#include <iostream>`

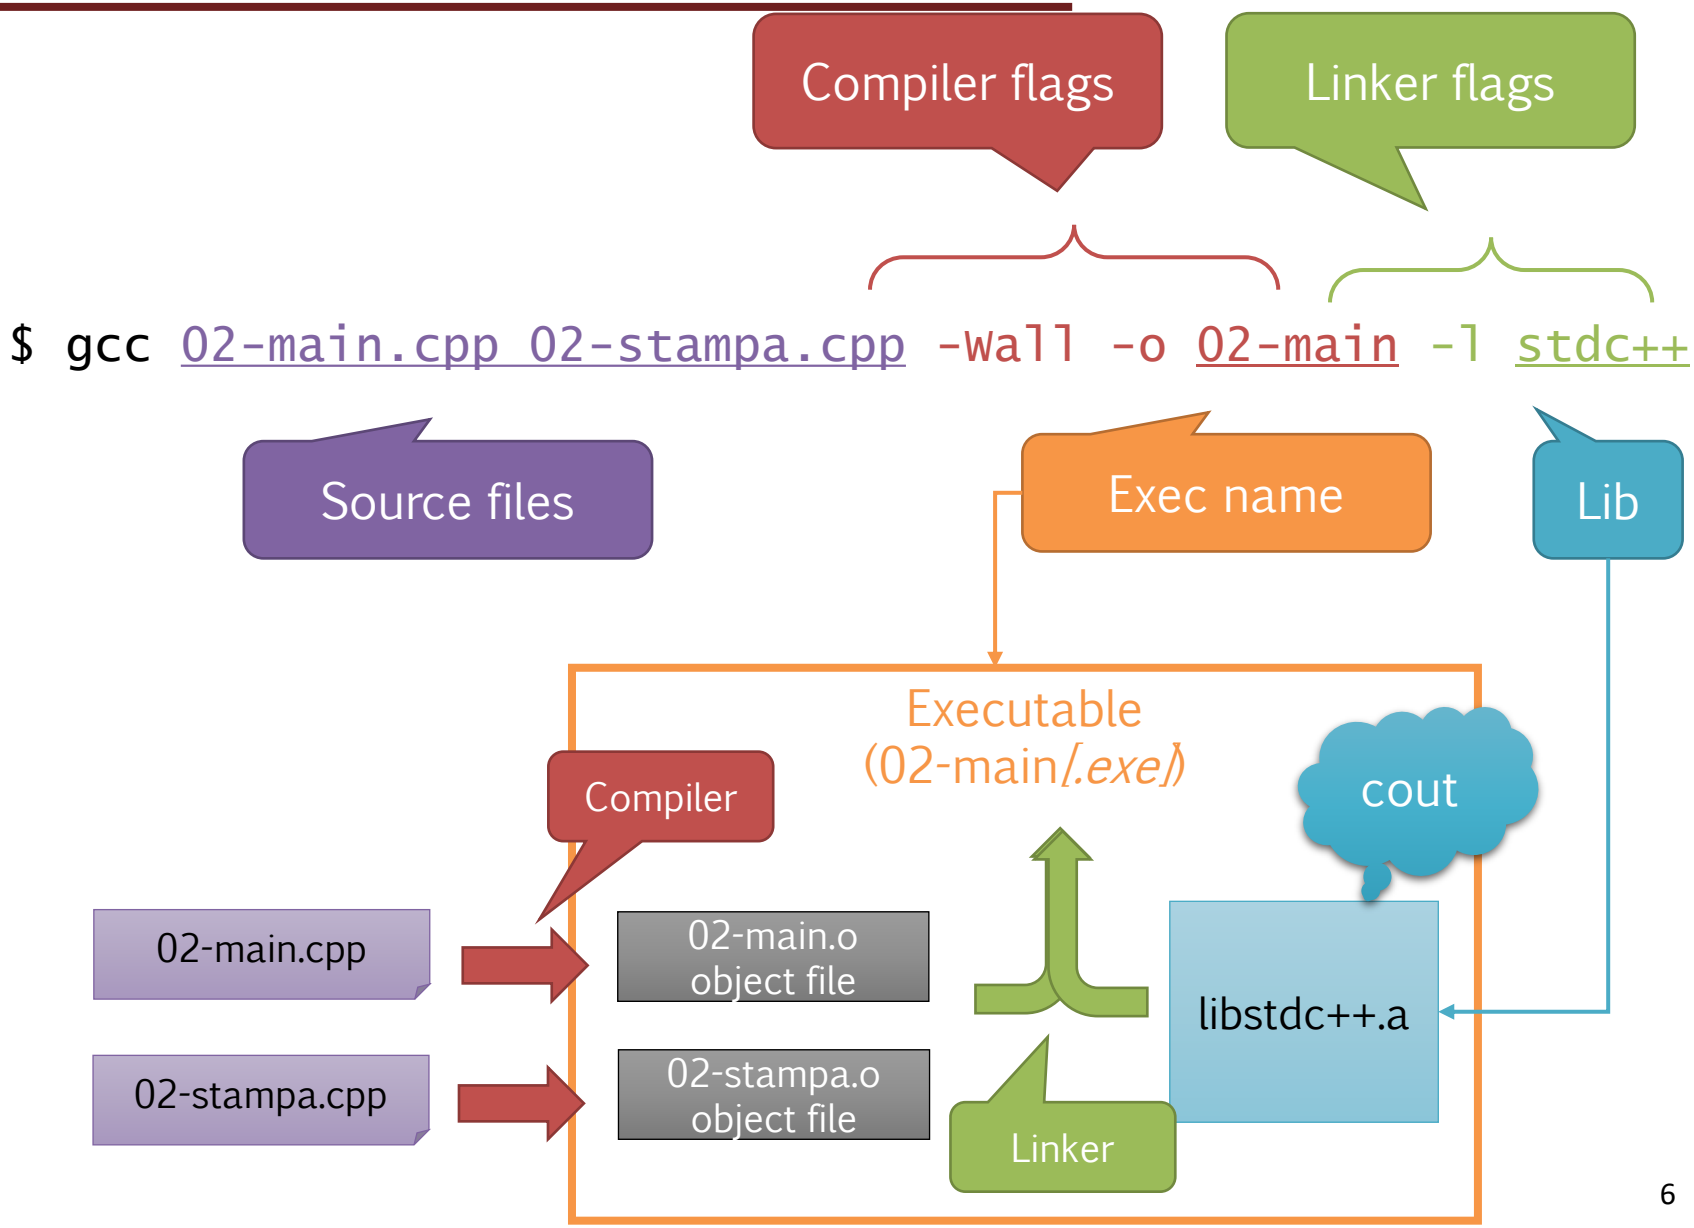
Grouped in namespaces

- `using namespace std;`
- `std::cout std::endl`

Then, link to library

- Es: to let linker (ld) find the **`libstc++.a`**
- `-l stdc++`
- `-l` always last flag in compilation line!

Compilation chain

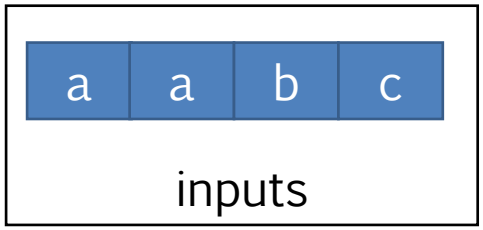


Arrays vs. pointers

```
const char inputs[] = {'a', 'a', 'b', 'c'};
```

Type

Size is implicit in declaration



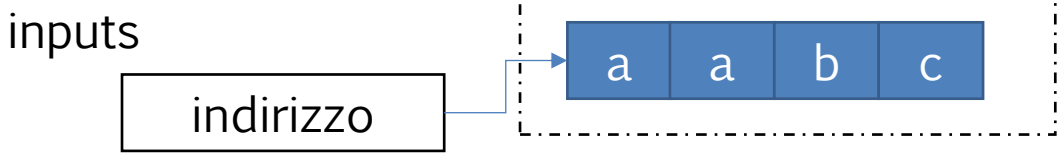
inputs[1] = ...

Object on heap memory

```
char *inputs = new char[4];
```

inputs[1] = ...

Another variable (32- or -64-bit pointer type)



C vs. C++

	C	C++
Memory allocation	`malloc`	`new`
Memory disposal	`free`	`delete, delete[]`
Stdout	`printf`	`cout << …`
stdin	`scanf`	`cin >> ..`
Includes	`#include <stdio.h>`	`#include <iostream>`
Namespaces	N/A	`Using namespace std;`

Preprocessor macros

#include <*SYSTEM-HEADER*>

› Located in (default) system folders

› `/usr/include - /usr/local/include - /usr/share/include`

#include "*MY-HEADER.H*"

› Relative (to where you **compile**) or absolute path

#define *SYMBOL [VALUE]*

› You can use this symbol: it's a macro/replacement, not a variable!

› You can check it exists
  - `#ifdef SYMBOL - #ifndef SYMBOL - #if defined(SYMBOL)`
  - `#endif`
  - Can comment away portions of code!!

› Also, can use **–D*SYMBOL*** in compilation line

Other stuff

- Ternary operator (used mainly in assignments)

```
<COND> ? <VALUE-IF-TRUE> : <VALUE-IF-TRUE>
```

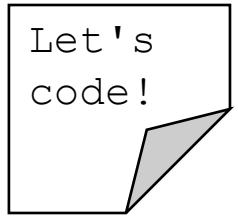
```
bool b = true;
std::string s = b ? "TRUE" : "FALSE"; // s is "TRUE"
```

- Passing (and consuming) arguments to (within) your program

```
$ ./myprogram parameter
```

```
int main(int argc, char **argv)
{
  // argc is 2
  // argv[0] is "myprogram"
  // argv[1] is "parameter"
```

How to run the examples



› Find them in `Code/` folder from the course website

For C++: compile

```
› $ gcc code.cpp -o code -Wall -l stdc++
```

Run (Unix/Linux)

```
$ ./code
```

Run (Win/Cygwin)

```
$ ./code.exe
```
